

BAILLIE GIFFORD

Keystone Positive Change Investment Trust plc

TCFD Climate Report for the year ending 31 December 2022

Prepared using the Task Force on Climate-related Financial Disclosures (TCFD) recommendations.

Introduction

Keystone Positive Change Investment Trust aims to generate long term capital growth with the aim of the NAV total return exceeding that of the MSCI AC World Index in Sterling terms by at least 2% per annum over rolling five-year periods and contributing towards a more sustainable and inclusive world by investing in the equities of companies whose products or services make a positive social or environmental impact. More information on the managers' philosophy, process, performance and other insights can be found on the Trust's webpages accessed via the Baillie Gifford website.

This report explains the managers' approach to addressing climate-related risks and opportunities through the investment process and describes a current view of how they may impact the portfolio. It also includes data and metrics to provide useful additional information. The report was produced using the recommendations of the Task Force on Climate-related Financial Disclosures (TCFD), and it is expected the content, format and data will evolve in future versions.

Climate commitments

The Keystone Positive Change Investment Trust has two objectives: to deliver superior investment returns and a positive social and/or environmental impact. Naturally, this includes climate change. As such, many of our portfolio companies are helping to decarbonise the economy and help societies adapt to climate change.

In addition to our investment activities, we believe that we, as investors, can contribute towards addressing climate change through support for investee companies and through our engagement. We have formalised our commitment to supporting a net zero aligned economy through joining the Net Zero Asset Manager's Initiative.

Our ambition is ultimately for 100% of the assets in the trust to be managed in line with the overarching requirements and long-term ambitions of the net zero emissions commitment. However, at this time we have omitted companies that were private from our NZAMI commitments because they are at such an early stage of growth that disclosure is limited and the emissions of the companies are likely to be insignificant when compared to the larger companies in the portfolio.

Below we have set out our interpretation of how we will achieve our commitment over time. Given the concentration of the portfolio and the objectives to deliver impact across a wide range of social and environmental challenges, we do not believe it is appropriate to set a target for the portfolio emissions as a whole. Instead, we will monitor individual company metrics, as set out in our expectations below, reporting against them annually in the strategy's ESG and Engagement Report "Positive Conversations".

Longer term:

- By the end of 2030 we commit that 90% (by number) of the portfolio will have appropriate net zero aligned targets
- By the end of 2040 we commit we will have full alignment with reporting and established decarbonisation pathways that can achieve net zero across the portfolio by 2050 or sooner

Within the next 5 years:

- By the end of 2023 (or within 2 years of entering the portfolio) we expect 90% (by number) of the portfolio to be reporting their Scope 1 and 2 emissions.
- By the end of 2024 (or within 3 years of entering the portfolio) we expect 75% (by number) of the portfolio to be reporting material S3 emissions; with 90% reporting by the end of 2026
- By the end of 2026 (or within 5 years of entering the portfolio) we expect 75% (by number) of the portfolio to have appropriate net zero aligned targets

Further details of this commitment can be found in our Positive Conversations Report on our website.

Governance of climate-related risks and opportunities

Details of Baillie Gifford's oversight and management of climate-related risks and opportunities across the firm can be found in the entity-level TCFD-aligned Climate Report on the Baillie Gifford website. At the portfolio level, the assessment and management of such risks and opportunities is the responsibility of the individual investment team.

Implications of climate change for strategy

Global efforts to address the emissions responsible for climate change and its physical impacts pose potential 'transitional' and 'physical' risks and opportunities for every portfolio company. Transitional factors include the introduction of new policies, regulations or technologies, while physical factors stem from chronic changes to climate patterns, sea level rise, or more acute severe weather events.

The managers believe climate change could materially influence the returns generated for clients. However, assessing the significance and scale of this influence versus other factors over different timeframes is challenging. The managers expect their views to evolve as they gain better insight and understanding.

Below is a current assessment of the climate-related risks and opportunities the portfolio may face over the short, medium and long term under different climate scenarios. This assessment is based on Baillie Gifford's qualitative analysis of the Network for Greening the Financial System's (NGFS) 'orderly', 'disorderly' and 'hothouse world' scenarios.

'Orderly transition' scenarios assume climate policies are introduced early and become gradually more stringent, reaching global net zero emissions around 2050 and likely limiting global warming to below 1.5-2 degrees Celsius on pre-industrial averages. 'Disorderly transition' scenarios assume climate policies are delayed or divergent, requiring sharper emissions reductions achieved at a higher cost in order to limit temperature rise to below 1.5-2 degrees Celsius on pre-industrial averages. 'Hothouse world' scenarios assume only currently implemented policies are preserved, current commitments are not met and emissions continue to rise, with high physical risks and severe social and economic disruption and failure to limit temperature rise.

Short-term risks and opportunities (0-3 years)

Over the next few years, climate-related risks for most portfolio holdings are more likely to be transitional than physical. Although evidence shows climate change is already making weather events more erratic and severe, it is unlikely this will reach a systemic level of impact across the portfolio within a three-year timeframe, even under a hothouse world scenario. That said, direct impacts could be significant for some companies.

However, this timeframe is much more significant for the trends in technology, policy and markets shaping the transition. Under both orderly and disorderly transition scenarios, the managers expect significant opportunities for holdings that are directly helping to drive the decarbonisation of the economy through their core products or services (for example, renewable energy provider Ørsted, battery manufacturer Northvolt, and precision agriculture manufacturer Deere). Companies in the portfolio showing other forms of climate leadership (such as Nu Holdings) should also benefit. They may avoid regulatory penalties, gain access to advantaged technologies and reinforce their brands.

Conversely, both orderly and disorderly scenarios increase the transitional risks for holdings that make a significant contribution to the portfolio's weighted average carbon intensity (WACI) through their direct or indirect emissions, although the timing may vary in different markets. These include holdings such as TSMC and Umicore which may face higher costs to operate or other restrictions as emissions regulations tighten and the costs of carbon increase.

Under hothouse world scenarios the risks and opportunities noted above may not accrue over this time horizon. Indeed, there may be comparative cost penalties to climate leadership. That might allow high emitters and those with carbon-intensive value chains to defer investment or diversification and benefit from near-term cashflows and returns.

Medium-term risks and opportunities (3-10 years)

Over the medium term, which overlaps the typical period that the managers expect to hold new portfolio additions (5-10 years), the impact of an orderly versus disorderly transition may become more divergent. Under an orderly transition, there are likely to be significant opportunities for companies providing climate solutions and those that can reduce their emissions substantially this decade. However, under a more disorderly transition, these opportunities may be more muted as regional diversity in climate policy introduces additional complexity.

Over this timeframe, the physical impacts of climate change are expected to become more systemic. The geographical and sectorial diversity of holdings across the portfolio may provide some resilience to regional climate impacts. However, the portfolio holds some businesses with higher levels of potentially significant geographic concentration (such as HDFC, Safaricom and Bank Rakyat) and others reliant on complex international supply chains (such as TSMC).

The fund is exposed to opportunities as well, particularly through those holdings which are providing technologies which enable societies to adapt to the physical impacts of climate change, such as precision agricultural technologies of Deere, the water efficiency technologies of Xylem, and the enzyme technologies of Novozymes.

Long-term risks and opportunities (10+ years)

Assessing risks and opportunities to the portfolio over these timeframes becomes particularly challenging due to the increased uncertainties involved. However, under a hothouse world scenario, it is anticipated that the influence of physical climate impacts becomes the chief climate-related risk to returns. Under this scenario, the impact on policy, populations and overall economic activity - and thus shareholder returns - is likely to be portfolio-wide and systemic, with very few holdings unaffected.

Under orderly or disorderly transition scenarios, the impacts on the portfolio observed in the medium term may become further extended and entrenched. Risks and opportunities associated with technologies and markets may become even more significant as the winning forces of the transition emerge, causing the old to fall away. Under a disorderly scenario, regions of the world that were delayed in their transition might be expected to play 'catch up', offering new opportunities for transition-aligned companies. However, the sheer rapidity of the transition may result in greater policy dislocation and abrupt asset retirement that could transcend individual companies to pose systemic risks to the portfolio.

Approach to climate risk management

The managers of the Keystone Positive Change Investment Trust aim to assess all holdings in the portfolio at least annually as part of Baillie Gifford's 'climate audit' process. This helps inform their view of climate-related risks and opportunities across the portfolio. The results are shown in the metrics section of this report. Holdings are assessed on two main criteria:

- Their emissions reduction goals and performance. Holdings are categorised as 'leading', 'preparing', or 'lagging' based on an assessment of their ambition and related strategies to reach net zero emissions by 2050 or before.
- Their potential transition role. Holdings are categorised as 'solutions innovators', 'carbon-light potential influencers', 'potential evolvers' or 'materially challenged' based on an assessment of their strategic positioning relative to the net zero transition.

In addition to the climate audit process, the managers consider climate risks through the research and engagement processes for both new buy and existing holdings, and conducts more in-depth research into specific holdings where they feel climate-related risks could be particularly material. This research utilises a variety of information sources and is supported by dedicated Impact Analysts and Baillie Gifford's central climate team. The insights can be discussed at stock discussions, Portfolio Construction Group meetings or at Portfolio Review Group meetings and are shared among the investment team and colleagues across Baillie Gifford through the research library.

From 2023 onwards, as part of the integration of climate-related risks into Baillie Gifford's overall risk management framework, the climate metrics used in this report will be incorporated into the existing Investment Risk Reports that are provided to the portfolio managers by Baillie Gifford's Investment Risk team. To help provide additional oversight, three core metrics (the Weighted Average Carbon Intensity, fossil fuel exposure and the percentage of holdings not assessed under our 'climate audit' process) will also be reported to Baillie Gifford's ESG Regulatory Sub-Group and either the Equity or Multi Asset and Fixed Income Investment Risk Committees.

Key metrics (as at end December 2022)

The following metrics are used as part of the managers' assessment of climate-related risks and opportunities across the portfolio and they believe they are useful to stakeholders. The metrics include but are not limited to the Carbon Footprint, Weighted Average Carbon Intensity and Total Emissions of the portfolio as required by the UK Financial Conduct Authority's product-level climate disclosure rules. These rules also require Baillie Gifford to determine if a portfolio has concentrated exposures or high exposures to carbon intensive sectors¹ and if so to include quantitative scenario analysis metrics. In such cases, the managers therefore also include climate value-at-risk metrics in this section if they can obtain data for at least 70% of the portfolio (by AUM) from their data supplier. However, unless specifically required, Baillie Gifford has chosen not to provide climate value-at-risk metrics or implied temperature rise metrics for all portfolios as they believe current methodologies do not render them practicable for widespread use and potentially could lead to inaccurate or misleading disclosures particularly when there are significant gaps in the underlying data. More explanation on the metrics used in this section can be found in the footnotes. Any climate targets or objectives set by the portfolio are detailed in the earlier sections of this report.

Note on data availability and benchmarks

Data for some holdings – in particular those not listed on a stock exchange - is currently unavailable from the managers' data supplier. The metrics presented in this section may therefore not cover the entire portfolio. You can find details of the percentage of the portfolio for which data is reported, estimated or unavailable in the 'Emissions data availability and disclosure from holdings' table below. The disclosure of metrics associated with the managers' own assessments of holdings' transition role and targets is intended to help address gaps in data from external data suppliers, and they will continue to explore additional solutions to this in future as the climate data landscape continues to evolve. Cash and derivatives are presently excluded.

Benchmark metrics have been provided for comparison purposes only and relate to the financial benchmark used by the portfolio. The benchmark used for this portfolio is the MSCI ACWI Index.

Emissions metrics

Total carbon emissions ² from assets held by the portfolio	Portfolio Benchmark	
Total Scope 1&2 emissions (tCO ₂ e)	1,415	N/A
Total Scope 1,2 & material ³ Scope 3 emissions (tCO ₂ e)	20,617	N/A
Total Scope 3 emissions (tCO ₂ e)	29,781	N/A
Total Scope 1,2&3 emissions (tCO ₂ e)	31,196	N/A

Source: Baillie Gifford, MSCI, FactSet

¹ We define portfolios with 'concentrated exposures or high exposures to carbon intensive sectors' as those with either 1) a weighted average carbon intensity (on a Scope 1,2 & material Scope 3 basis) above that of their respective financial performance benchmark index or the MSCI ACWI index, or 2) a higher level of exposure to holdings generating more than 5% revenues from oil, gas or thermal coal activities than their respective financial performance benchmark index or the MSCI ACWI index.

² The total emissions of the portfolio represent the absolute greenhouse gas emissions from assets held, allocated on an ownership basis. This means a portfolio holding 1% of a company's enterprise value would be attributed 1% of the company's emissions.

³ We define material Scope 3 emissions using the original definition provided by the Partnership for Carbon Accounting Financials (PCAF), mapped to GICS sub-industries. This means that our version of material Scope 3 emissions are those produced by holdings classified as oil & gas or mining companies. We acknowledge the updated timeline to also include Scope 3 emissions from those classified as transportation, construction, buildings, materials and industrial companies has changed from 2024 to 2023 and are working to update systems accordingly. (p51, [The Global GHG Accounting and Reporting Standard for the Financial Industry \(carbonaccountingfinancials.com\)](#))

Carbon footprint ⁴ of the portfolio	Portfolio	Benchmark
Scope 1&2 emissions (tCO ₂ e) per \$M invested	7	58
Scope 1,2 & material Scope 3 emissions (tCO ₂ e) per \$M invested	106	251
Scope 1,2&3 emissions (tCO ₂ e) per \$M invested	161	418

Source: Baillie Gifford, MSCI, FactSet

Weighted average carbon intensity (WACI) ⁵ of the portfolio	Portfolio	Benchmark
Scope 1&2 emissions (tCO ₂ e) per \$M revenue	36	149
Scope 1,2 & material Scope 3 emissions (tCO ₂ e) per \$M revenue	141	478
Scope 1,2&3 emissions (tCO ₂ e) per \$M revenue	558	911

Source: Baillie Gifford, MSCI, FactSet

Emissions data availability and disclosure from holdings in the portfolio ⁶	Portfolio	Benchmark
% of total AUM invested in holdings where reported Scope 1&2 emissions data is available from our data provider	55	85
% of total AUM invested in holdings where estimated Scope 1&2 emissions data is available from our data provider	36	15
% of total AUM invested in holdings where Scope 1&2 emissions data is not available from our data provider	9	0
% of total AUM invested in holdings where reported Scope 3 emissions data is available from our data provider ⁷	54	74
% of total AUM invested in holdings where estimated Scope 3 emissions data is available from our data provider	91	100
% of total AUM invested in holdings where Scope 3 emissions data is not available from our data provider	9	0
% of total AUM invested in holdings disclosing to CDP annually	56	82

Metrics providing additional insights into climate-related risks and opportunities

Exposure to 'climate material' sectors ⁸	Portfolio	Benchmark
% of total AUM invested in companies in 'climate material' sectors	38	34

Source: Baillie Gifford, FactSet

⁴ The carbon footprint of the portfolio represents the aggregated GHG emissions per million £/\$ invested and allows for comparisons of the carbon intensity of different portfolios.

⁵ The WACI of the portfolio represents the aggregated carbon intensities of the companies in a portfolio, scaled by size of holding. The WACI metric therefore helps measure a portfolio's exposure to high carbon intensity companies.

⁶ These metrics provide a guide to the level of reported vs. estimated vs. unavailable data in all emissions metrics for the portfolio. Further explanation of our use of metrics, their quality and coverage, is available in the [Baillie Gifford & Co Climate Report](#).

⁷ In many cases, companies only report part of their Scope 3 emissions (for example business travel). This means that whilst there is some reported data, it does not always equate to full reported Scope 3 emissions across all Scope 3 categories covered by the GHG Protocol. Where all Scope 3 data is estimated by our data provider, it does include emissions across all Scope 3 categories. For consistency, only estimated Scope 3 data is included in carbon calculations.

⁸ Our definition of 'climate-material sectors' uses the TCFD 'carbon related assets' definition, i.e., any company operating in the Energy, Transportation, Buildings and Materials, Agriculture, or Food and Forests sectors, mapped by GICS sub-industry.

Exposure to fossil fuels	Portfolio Benchmark	
% of total AUM invested in companies with > 5% revenues from oil and/or gas activities ⁹	5	10
% of total AUM invested in companies with > 5% revenues thermal coal mining and sale ¹⁰	0	0
% of total AUM invested in companies with > 5% revenues from thermal coal power generation	0	1

Source: Baillie Gifford, MSCI, FactSet

Metrics providing insights into net zero alignment of holdings

Our assessment of holdings' net zero targets ¹¹	Portfolio
% of total AUM with targets assessed as 'leading'	44
% of total AUM with targets assessed as 'preparing'	20
% of total AUM with targets assessed as 'lagging'	37
% of total AUM with targets not assessed	0

Source: Assessed according to Baillie Gifford's internal assessment framework.

Our assessment of holdings' transition role ¹²	Portfolio
% of total AUM assessed as 'solutions innovators'	24
% of total AUM assessed as 'potential influencers'	45
% of total AUM assessed as 'potential evolvers'	31
% of total AUM assessed as 'materially challenged'	0
% of total AUM not assessed	0

Source: Assessed according to Baillie Gifford's internal assessment framework.

Science-Based Targets ¹³ alignment among holdings	Portfolio	Benchmark
% of total AUM invested in companies with targets approved by Science-Based Targets Initiative	35	35
% of total AUM invested in companies who have committed to set targets approved by the Science-Based Targets Initiative	19	16

Source: SBTi

⁹ Includes oil and/or gas extraction and production, distribution, retail, equipment and services, petrochemicals, pipelines and transportation and refining. Excludes biofuel production and sales, and trading activities.

¹⁰ Includes the mining of thermal coal (including lignite, bituminous, anthracite and steam coal) and its sale to external parties. Excludes metallurgical coal, coal mined for internal power generation, intra-company sales of mined thermal coal and revenue from coal trading.

¹¹ In some cases, portfolios with higher proportions of unlisted or smaller companies may contain a greater proportion of holdings assessed as 'lagging'. This may be due to the relative immaturity of some of these companies' disclosure and net zero alignment strategies, when compared to more established listed and larger companies. More details of this assessment process can be found in the [Baillie Gifford & Co TCFD Climate Report](#)

¹² More details of this assessment process can be found in the [Baillie Gifford & Co TCFD Climate Report](#)

¹³ Using the framework and methodology developed by the Science Based Targets Initiative. 'Approved' companies are those whose net zero targets have been validated by the SBTi. 'Committed' companies are those who have submitted a commitment letter and are in the process of setting and submitting science-based net zero targets or their targets are currently being validated.

Legal Notices

Baillie Gifford uses a combination of internal research and analysis and third-party data sources when preparing ESG-related disclosures.

Prior to using data sourced from a third-party provider, Baillie Gifford conducts appropriate due diligence on the third-party provider including validation of their methodology and assessment of their coverage and then carries out spot checks of the data periodically, escalating issues to the third-party provider where necessary.

However, Baillie Gifford cannot guarantee that such data is complete, up-to-date and/or accurate. Furthermore, information disclosed is based on data established at a specific time which may be liable to change. More generally, the coverage, standardisation, and comparability of ESG data continues to change and develop over time.

This disclosure is not intended to be used for marketing purposes and nor does it constitute investment advice or a recommendation to make (or refrain from making) any kind of investment decision and may not be relied on as such.

The figures in this report are aggregations and calculations which draw upon data from our external data providers, principally MSCI.
